

News Release

Replaceable Polyurethane Screens Use them as you need them

Screening media value just increased and the wear life just got longer. The people at Unified Screening & Crushing are now offering a replaceable synthetic modular screening system....allowing you to have the flexibility to use polyurethane or rubber, without permanent deck modifications.

Now you can screen your material with wire cloth - then at any time change over to a removable system.

The proprietary FLOWMAX modular tension frames combine the convenience of an easy change-out with the benefits of a modular system. **You can replace any module in seconds, or the entire system in minutes.** Polyurethane can be used to reduce blinding, provide maximum throughput and increase wear life with no commitment to screen deck modifications. Recent Field Reports acknowledge a 5% to 15% more open area than other comparable systems. Unified reports... "they last 15 times the life of Wire Cloth".

Unified designs and manufactures screening media to meet actual customer production needs. Most of their screening media has been inspired by in-field job applications, "therefore..." says Bob Kleason, the Unified director of marketing and sales, "they perform better on the job". Bob goes on to say, "We don't just sell products, we solve customer problems. To be successful at that, nothing beats field experience. All Unified Field Reps know the various local materials, local processing conditions and other factors that affect wear life and throughput."

The replaceable FLOWMAX modular tension frame with polyurethane modules.

Unified® inspects material flow and production with customer.
