

Press Release

Unified® Screening & Crushing Announces TwinWire™ for High Impact Applications.

Unified's new TwinWire™ Screen was designed for high impact, top deck applications. Typically used for 1 1/2" openings and larger - this new construction provides greater durability, while maintaining maximum open area. High carbon, stainless steel, or, Tufflex™ wire is recommended and can be made to fit any screening area.

Special tooling has been designed for various wire diameters to ensure uniform openings with a strong lock-crimp construction. In some tested applications, field observations uncovered a 3/8" wire outperforming a 5/8" diameter, single-wire, construction.

TwinWire is another new product development by the Unified network as a result of customer research ...combining "in-the-field" and design experience with customer needs and requests.

The Unified network includes 13 individual, strategically located companies as well as other regional stocking and non-stocking distributors and alliances.

The Unified® Screening & Crushing companies manufacture and offer the widest range of screening media in North America, including; wire, rubber and polyurethane, in any standard or custom design. Also, the Unified network maintains the largest inventory of manganese crusher parts in North America. The various Unified engineering and sales teams focus on providing solutions for their customers' unique problems.
